

# Introduction to Data Mining

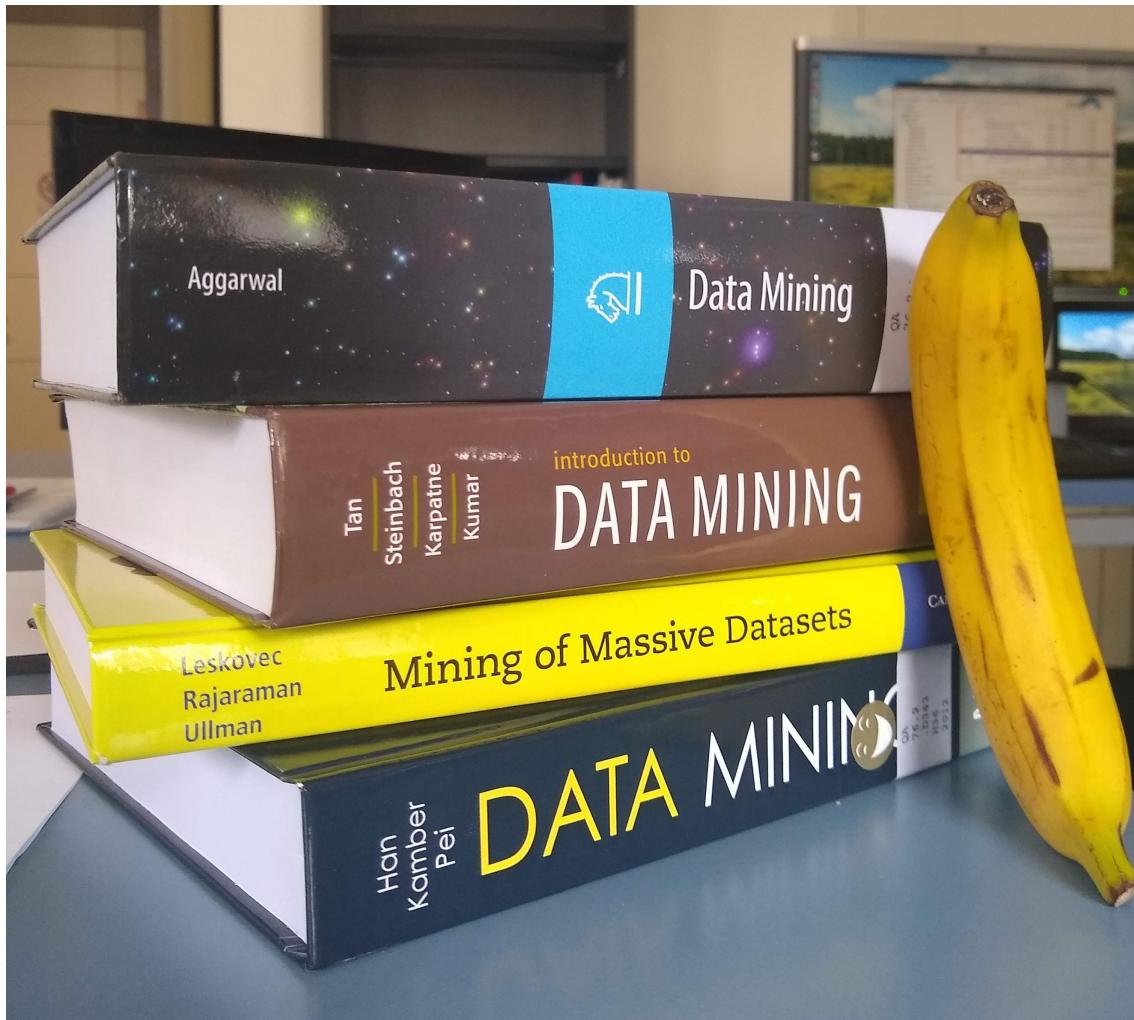

Mining Massive Datasets

Carlos Castillo

Topic 01

# Main Sources

- Data Mining, The Textbook (2015) by Charu Aggarwal (Chapter 1) + [slides by Lijun Zhang](#)
- Mining of Massive Datasets, 2<sup>nd</sup> edition (2014) by Leskovec et al. (Chapter 1)
- Data Mining Concepts and Techniques, 3<sup>rd</sup> edition (2011) by Han et al. (Chapters 1-2)

(Banana for scale)

# Data Mining

# What do these have in common?

Stone

Clay

Papyrus

Paper

Wax cylinder

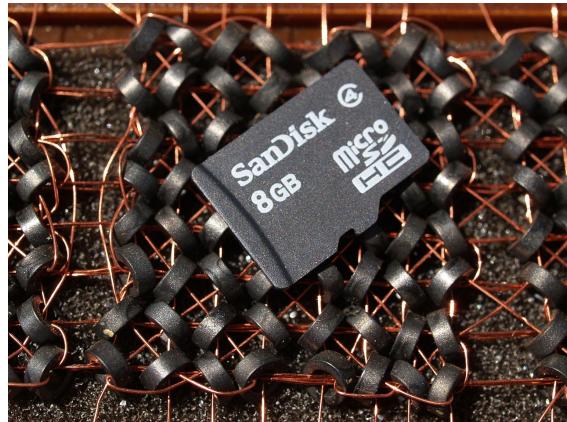

Tape

Vinyl

# what do these have in common?

8GB (front) vs 8B (back)

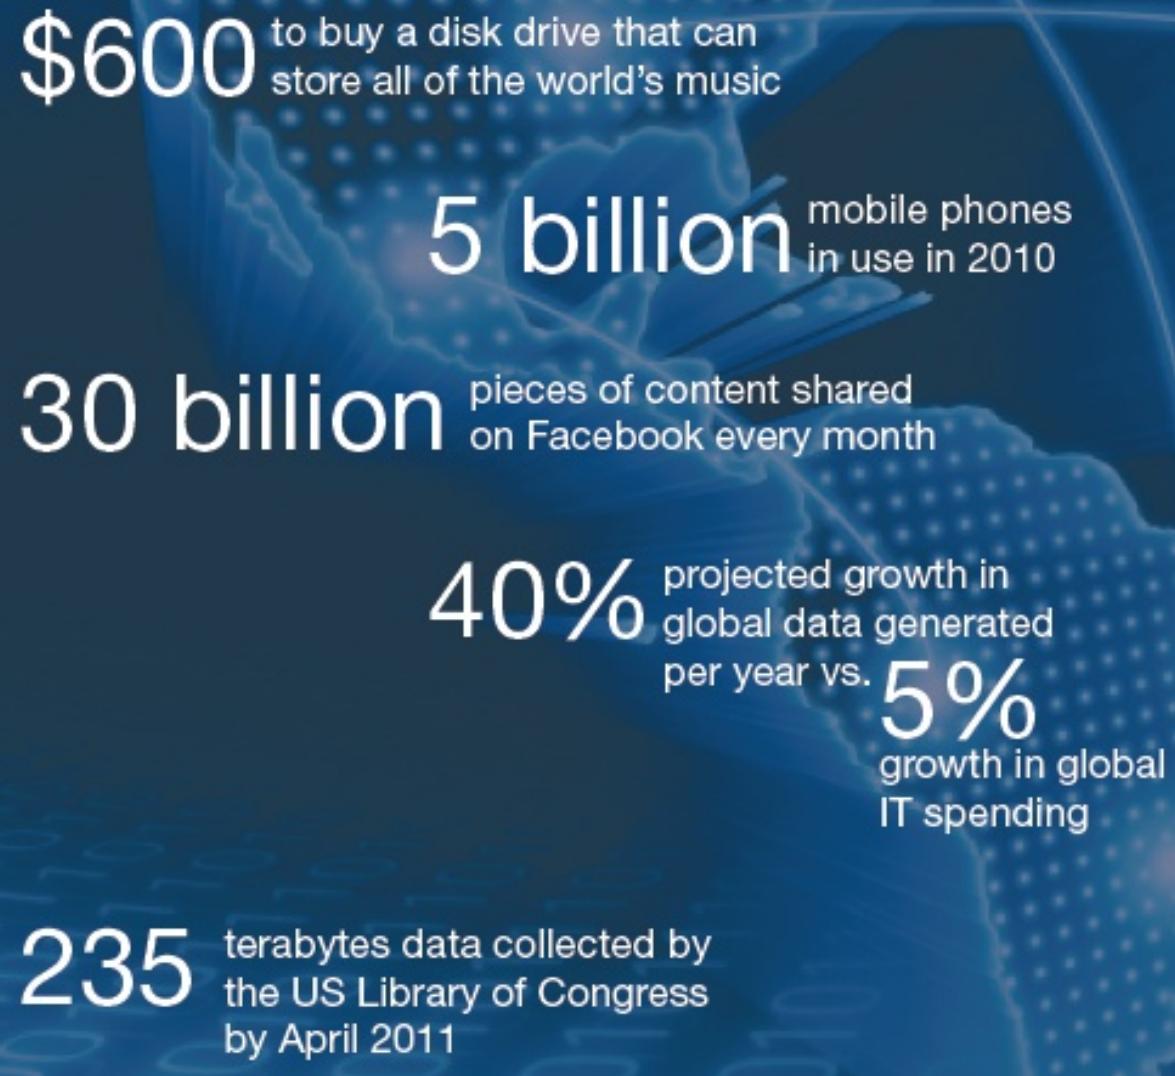

Floppy disks (8", 5 1/4", 3 1/2")

Compact disk

# The age of “Big Data”

**Marked by the co-evolution of**  
storage capacity,  
transmission capacity, and  
processing capacity

# Wikipedia definition

- **Data mining** is the process of
  - discovering patterns in
  - large data sets
  - involving methods at the intersection of
    - machine learning,
    - statistics, and
    - database systems.

# Informal definition

Given **lots of data**, discover **patterns** and **models** that are:

- **Valid**: hold on new data with some certainty
- **Useful**: should be possible to act on them
- **Unexpected or novel**: non-obvious
- **Understandable**: interpretable
- **Complete**: contain most of the interesting information

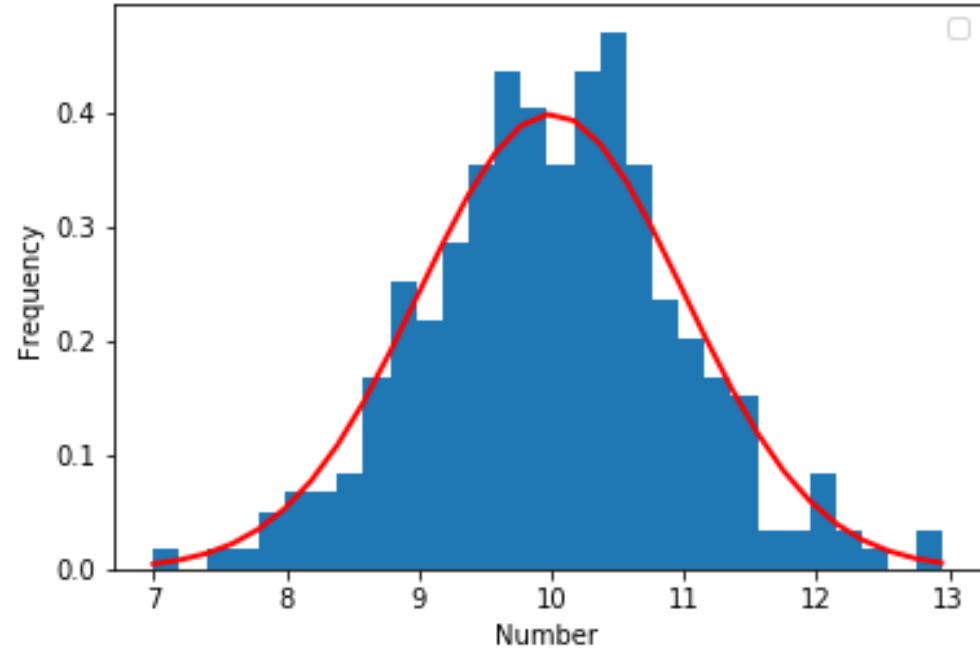

# Example: 300 numbers

8.5998019 10.82452538 10.25496714 9.9264092 10.26304865 8.80526888 8.96569273 9.00883512 9.82813977 10.19311326 9.6545295

# Example: 300 numbers (cont.)

Through *statistical modeling* we can find the data comes from a Normal distribution with mean 10 and standard deviation 1

- **Normal( $\mu=10, \sigma=1$ )** is a *model* for the data

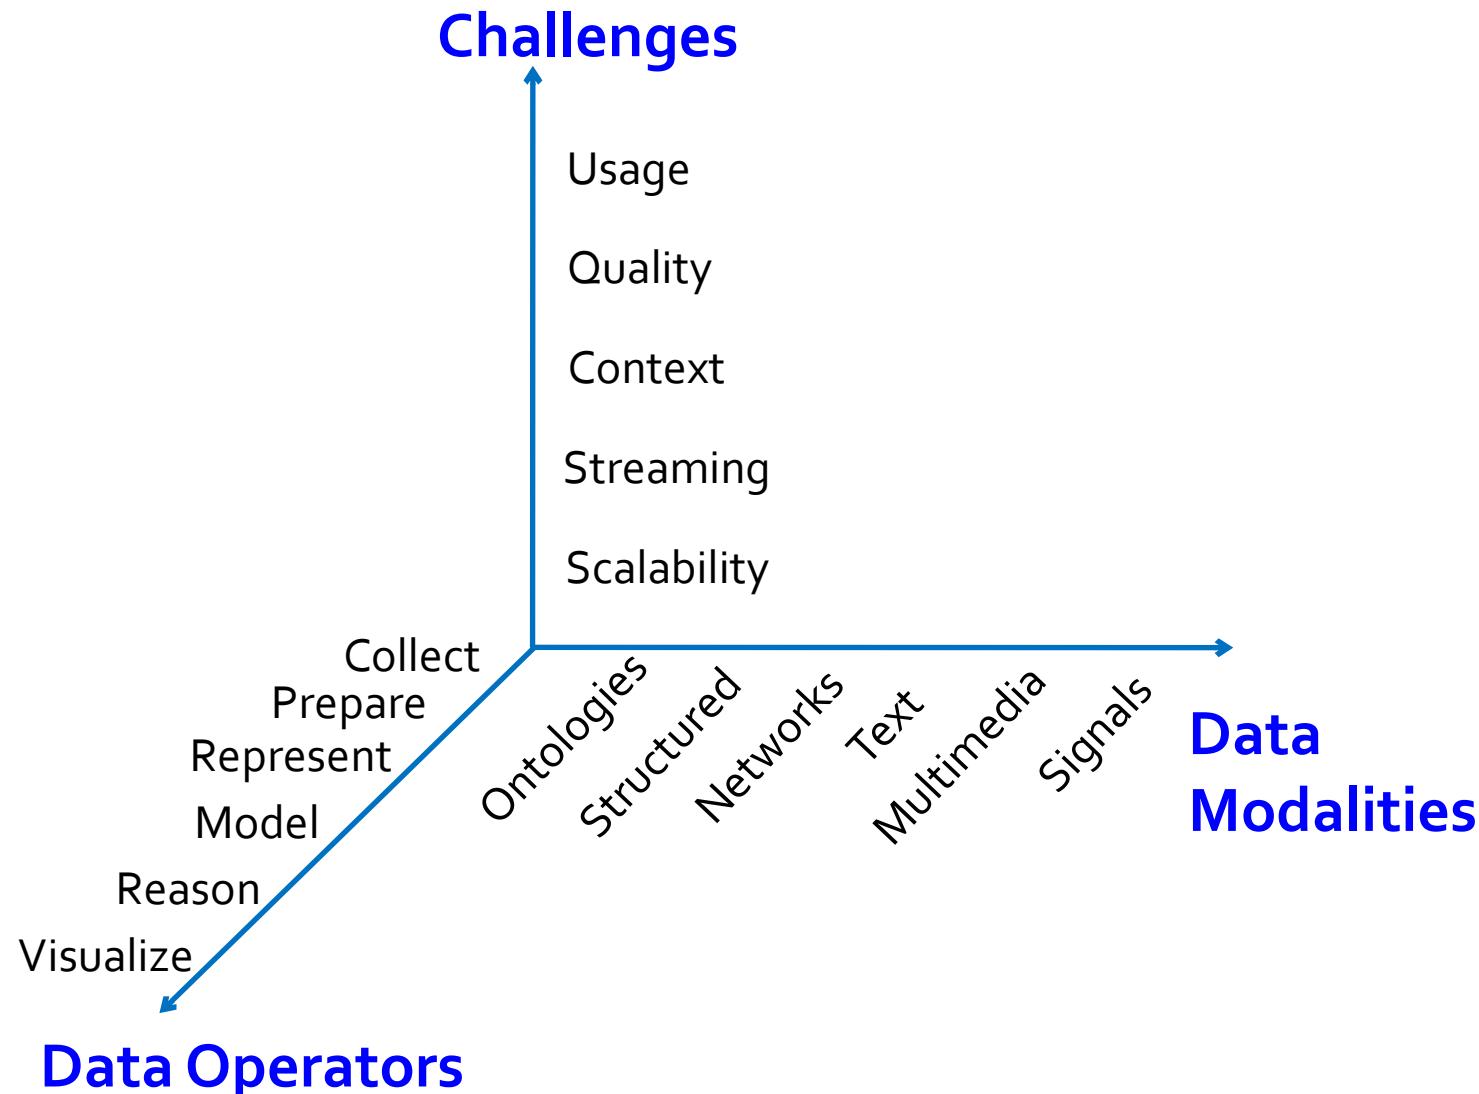

```
import numpy as np
import matplotlib.pyplot as plt

mu=10
sigma=1

sample = np.random.normal(mu, sigma, 300)
out, bins, ignored = plt.hist(sample, 30, density=True)
plt.plot(bins, 1/(sigma * np.sqrt(2 * np.pi)) * np.exp(
- (bins - mu)**2 / (2 * sigma**2) ), linewidth=2,
color='r')

plt.xlabel("Number")
plt.ylabel("Frequency")
plt.show()
```

# Describing vs Predicting

## Descriptive methods

- Find human-interpretable patterns that describe the data
- Example: Clustering

## Predictive methods

- Use some variables to predict unknown or future values of other variables
- Example: Recommender systems

# Characterizing vs Distinguishing

## **Data characterization methods**

- A summarization of the general characteristics or features of a target class of data

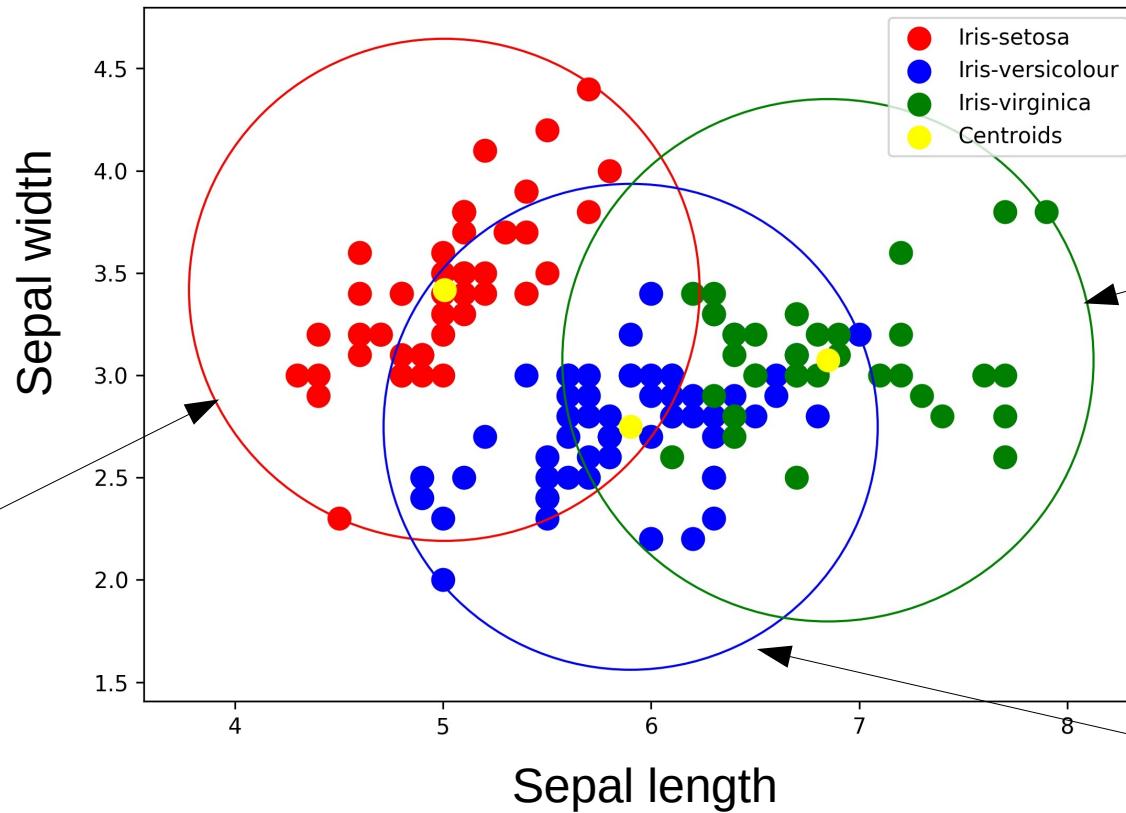

## **Data discrimination methods**

- A comparison of the general features of the target class data objects against the general features of objects from one or multiple contrasting classes

# Data mining has several goals

- To produce a **model**
  - E.g., a regression model for a numerical variable, or a classification model for a categorical variable
- To create a **summary**
- To extract **prominent features**

# Example summary: clustering

# Example: feature extraction

- Given shopping baskets of previous customers, determine:
  - Frequent itemsets** (bought together)
  - Similar items** (e.g., for recommendations)

# Risk #1: Spurious patterns

- A risk with “Data mining” is that an analyst can “discover” patterns that are **meaningless**
- *If you look in more places for interesting patterns than your amount of data will support, you are bound to find something (~Bonferroni principle)*

If you interrogate data  
**hard enough**  
it will tell you  
what you want to hear

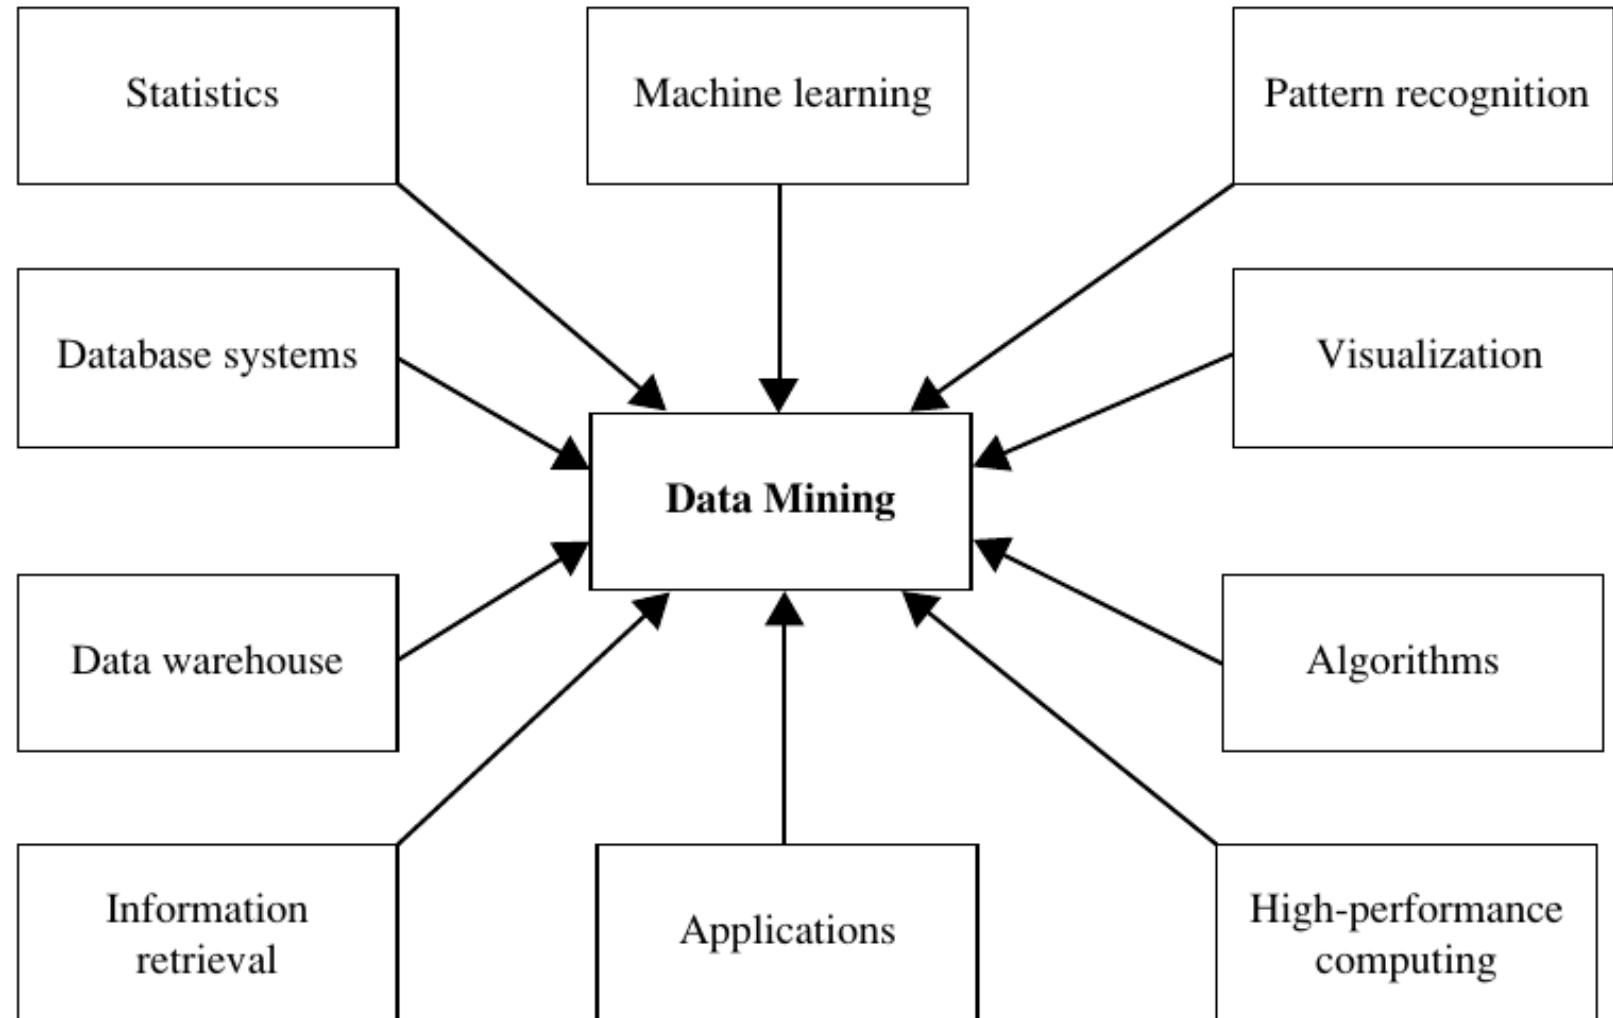

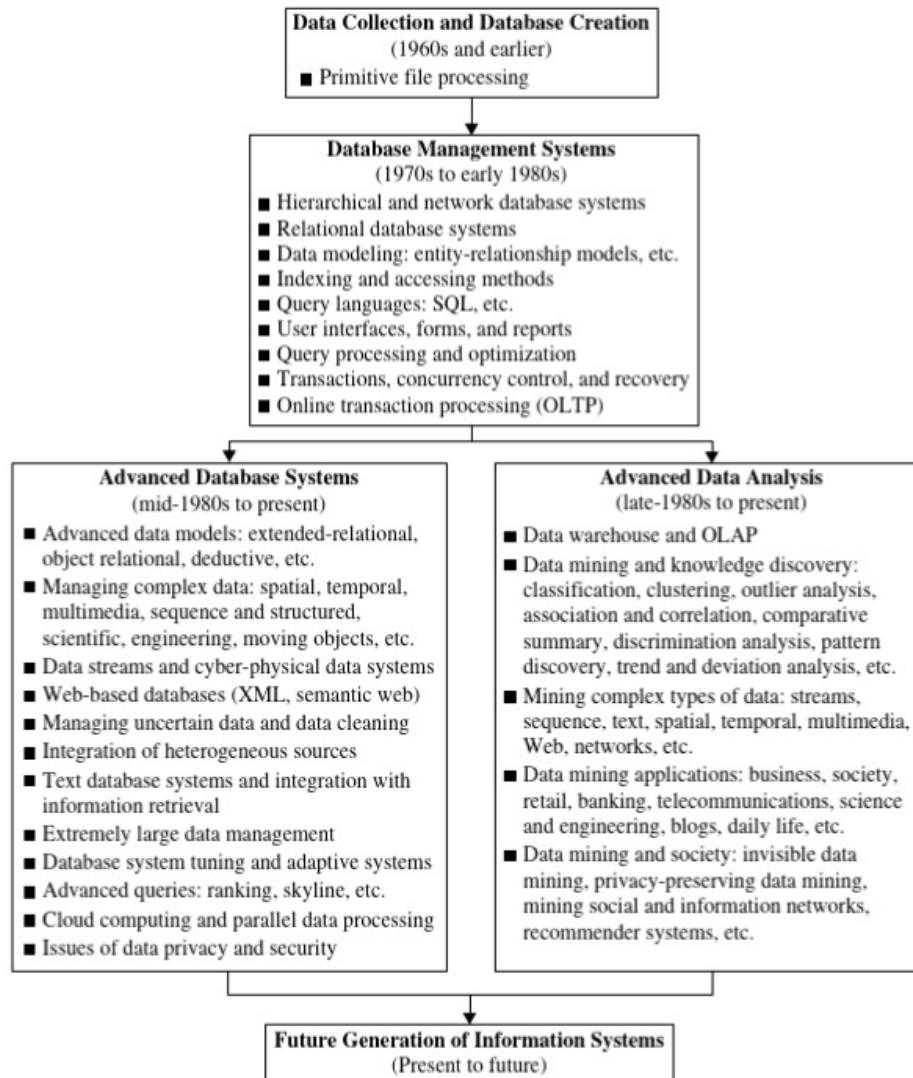

# Risk #2: Surveillance state

- Attention-grabbing evil actions are also very rare, with consequences:
  - Suppose 1 in a million is a suicide bomber
  - Catching one suicide bomber a year on average means examining 999.999 innocent people
- A system with 1% false positive rate will flag ~10K people as potential suicide bombers

# Data mining (DM) vs other disciplines

- For a database person, DM=analytic processing
- For a machine learning person, DM=modeling
- For an algorithms person, DM=efficiency
- Our focus will be on **scalable algorithms**

# Data mining is a descendant of methods for Online Analytical Processing (OLAP) done over Data Warehouses

# Data rich but information poor

- Fast-paced data streams become data archives that become data tombs
- Decisions could be better made by using data that already exists but is hard to “mine”

# Knowledge Discovery from Data

- KDD, a popular acronym
  - “Discovery” is Data Mining
- Other names: knowledge mining from data, knowledge extraction, data/pattern analysis

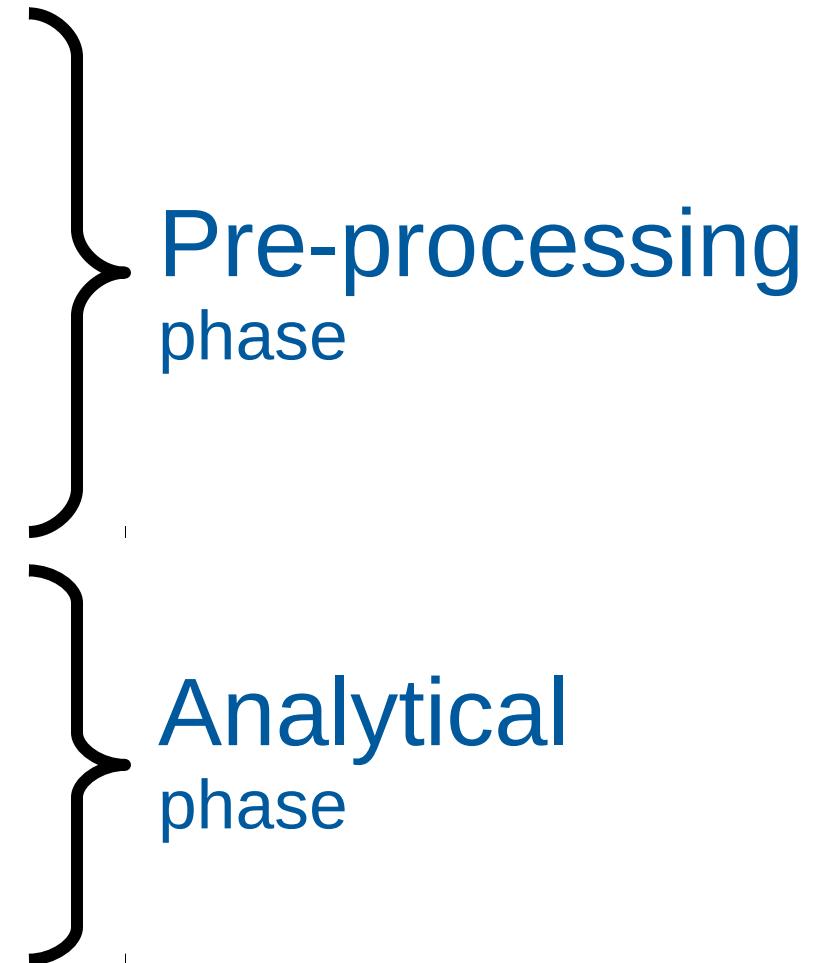

# Typical stages of KDD

- 1) Data Cleaning
- 2) Data Integration
- 3) Data Selection
- 4) Data Transformation
- 5) Data Mining ← application of a DM algorithm
- 6) Pattern Evaluation
- 7) Knowledge Presentation

# Typical stages of KDD

- 1) Data Cleaning
- 2) Data Integration
- 3) Data Selection
- 4) Data Transformation
- 5) Data Mining
- 6) Pattern Evaluation
- 7) Knowledge Presentation

# Data Types

# Nondependency / Dependency

- Nondependency oriented data can be structured so items are separate
  - Relational data, text data
- Dependency oriented data includes relationships between items
  - Graphs, time series

# Mixed attribute data

- Most attributes we will deal with are **numerical**, they quantify something
- Sometimes attributes are **categorical**
  - Categorical
    - Example: elephant, tiger, moose, ...
  - **Binary** (two categories)
    - Example: present, absent
  - **Ordinal** (two or more categories that can be naturally sorted)
    - Example: low, medium, high
- Real-world datasets include both types

# Binary attributes, sets, dummy vars.

- Every binary attribute can be used as a marker of belonging to a set and viceversa

| Name       | Age | Gender | Race             | ZIP Code |
|------------|-----|--------|------------------|----------|
| John S.    | 45  | M      | African American | 05139    |
| Manyona L. | 31  | F      | Native American  | 10598    |
| Sayani A.  | 11  | F      | East Indian      | 10547    |
| Jack M.    | 56  | M      | Caucasian        | 10562    |
| Wei L.     | 63  | M      | Asian            | 90210    |

- **One-hot encoding:** every categorical attribute taking one of k values can be encoded as k “dummy” binary attributes

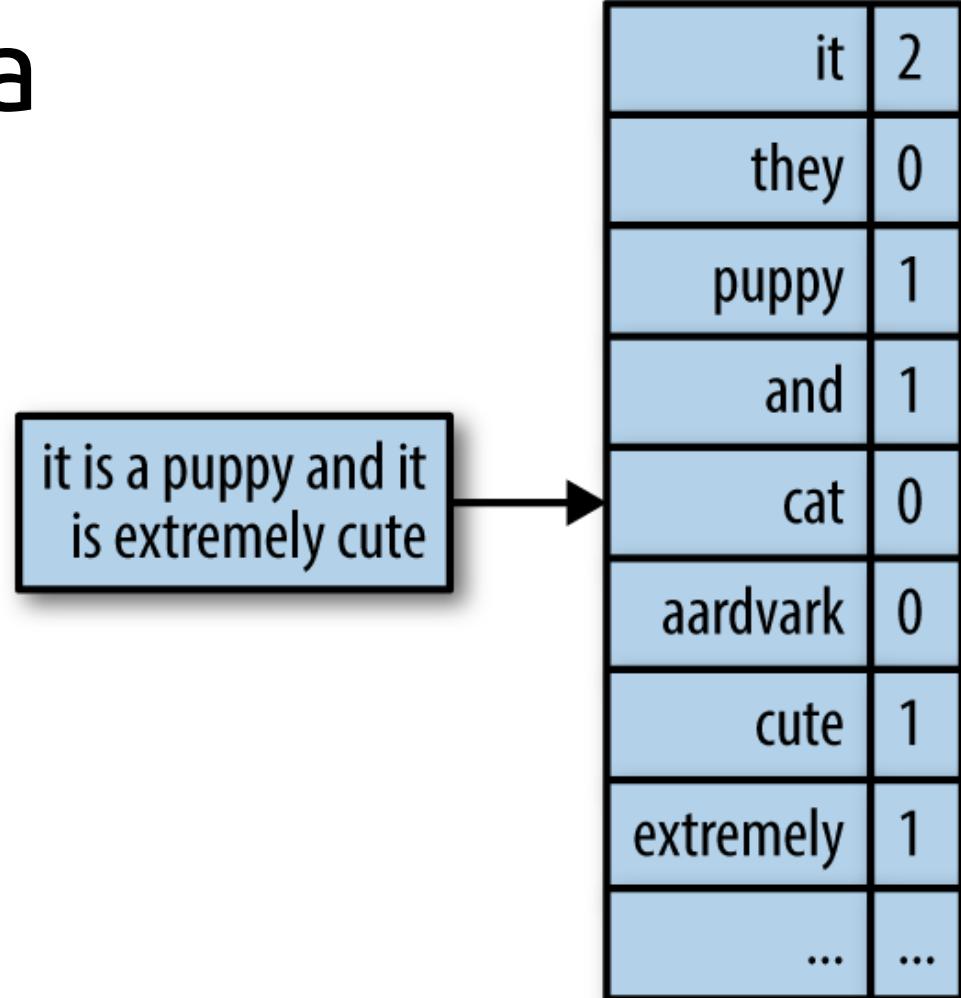

# Question

- Suppose you encode race and gender using one-hot encoding. How many columns do you obtain?

| Name       | Age | Gender | Race             | ZIP Code |
|------------|-----|--------|------------------|----------|
| John S.    | 45  | M      | African American | 05139    |
| Manyona L. | 31  | F      | Native American  | 10598    |
| Sayani A.  | 11  | F      | East Indian      | 10547    |
| Jack M.    | 56  | M      | Caucasian        | 10562    |
| Wei L.     | 63  | M      | Asian            | 90210    |

# Textual data

- Text can be represented as:
  - As a string
  - As a set of binary variables, one for each word in the dictionary, with value True iff the word belongs to the text (the “bag-of-words” model)
  - As a set of numerical variables indicating number of occurrences (the “vector space” model)

# Time series data

- **Contextual** attributes
  - Timestamps, sequence number, ...
- **Behavioral** attributes
  - Readings of a sensor, value of the variable, ...
- *Multivariate* time series data has multiple behavioral attributes

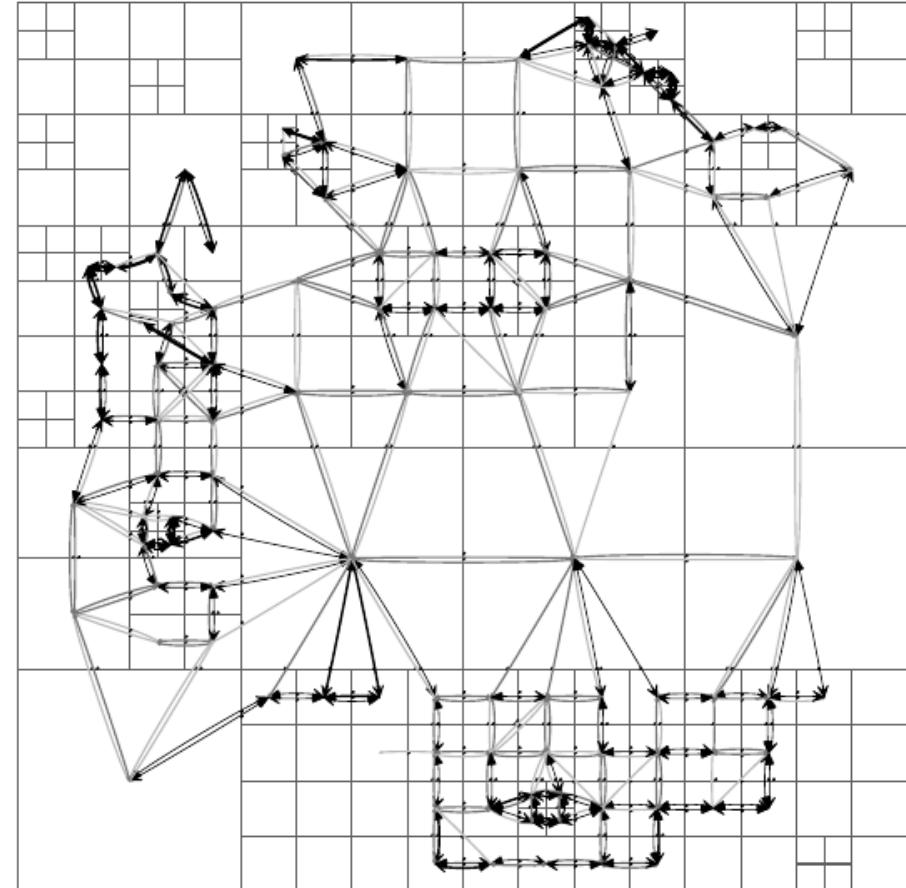

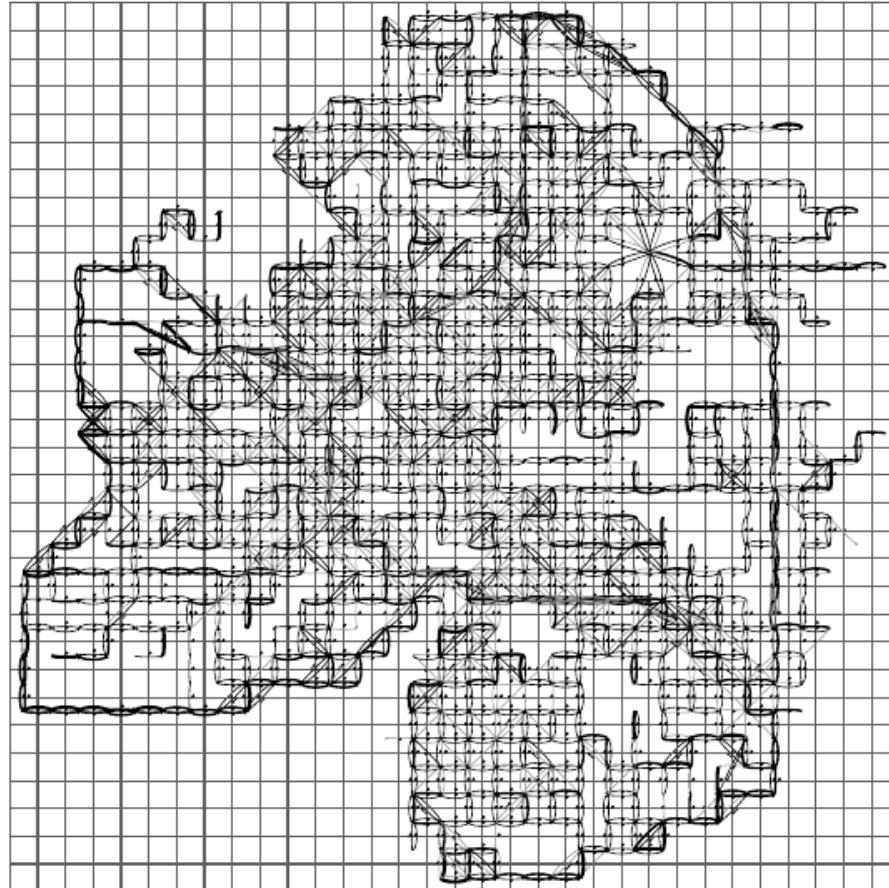

# Spatial data

- Two (lat/long) or three (lat/long/elevation) spatial attributes
- Represented by images
- Remote sensing data

# Spatiotemporal data

- Spatial and temporal attributes are contextual
  - Example: sea surface temperature
- Temporal attribute is contextual, spatial attribute is behavioral
  - Example: trajectories

# Aggregating trajectory data

Bonchi, F., Castillo, C., Donato, D., & Gionis, A. (2009). Taxonomy-driven lumping for sequence mining. Data Mining and Knowledge Discovery, 19(2), 227-244.

# Key elements

# Which kind of relationships? Columns or Rows?

- Between columns
  - Find associations, correlations, ...
  - If there is **one key column**: classification, prediction, ...
- Between rows
  - Find clusters
  - Detect outliers

# Association pattern mining

- Sparse binary databases representing, e.g., items a person is interested in

$$\begin{bmatrix} 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{bmatrix} \in \{0,1\}^{5 \times 4}$$

- The relative frequency of a pattern is its **support**

| Frequent Patterns | Support |
|-------------------|---------|
| {2,3}             | 3/5     |
| {1,4}             | 2/5     |

# Association pattern mining (cont.)

- Given a binary  $n \times d$  data matrix  $D$ ,
  - determine all subsets of columns such that all the values in these columns take on the value True for at least a fraction  $\text{min\_support}$  of the rows in the matrix.
- The relative frequency of a pattern is referred to as its **support**

# Association pattern mining (cont.)

- Given a binary  $n \times d$  data matrix  $D$ ,
  - determine all subsets of columns such that all the values in these columns take on the value True for at least a fraction  $\text{min\_support}$  of the rows in the matrix.
- The relative frequency of a pattern is referred to as its **support**

# Association pattern mining (cont.)

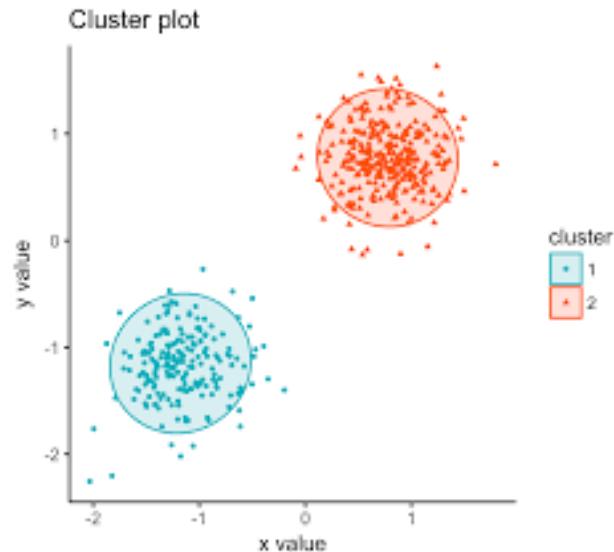

- The confidence of a rule  $A \rightarrow B$  is
  - $\text{support}(A \cup B) / \text{support}(A)$
- Example:
  - { Chips, Olives }  $\rightarrow$  { Beer }

# Try it!

- The confidence of a rule  $A \rightarrow B$  is
  - $\text{support}(A \cup B) / \text{support}(A)$
- Suppose
  - 10 people buy only Chips and Beer
  - 20 people buy only Chips and Olives
  - 30 people buy only Olives and Beer
  - 40 people buy all three: Chips, Olives, and Beer.
- What is the confidence of the rule  $\{ \text{Chips}, \text{Olives} \} \rightarrow \{ \text{Beer} \}$ ?

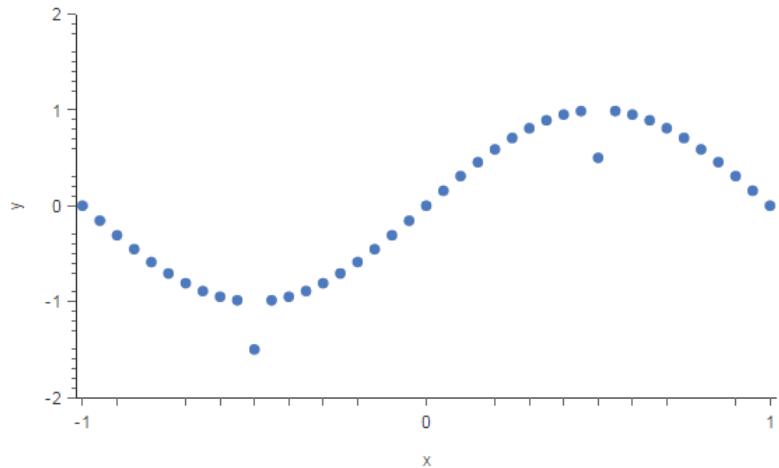

# Clustering

- Partition records/rows in a way that
  - elements in the **same partition** are **similar**
  - elements in **different partitions** are **different**
- *But what does it mean to be similar? How many sets? Can a record/row belong to two sets? To zero sets? ...*
- Applications:
  - Segmentation, summarization, ...
  - Sometimes a step in a larger DM algorithm

# Outlier detection

- Given a database, find records/rows that are **different** from the rest of the database
- *But what does it mean to be different? How many can be different? How different should they be?*
- Applications:
  - Intrusion detection, credit card fraud, interesting sensor events, medical diagnosis, ...

# Outlier detection (cont.)

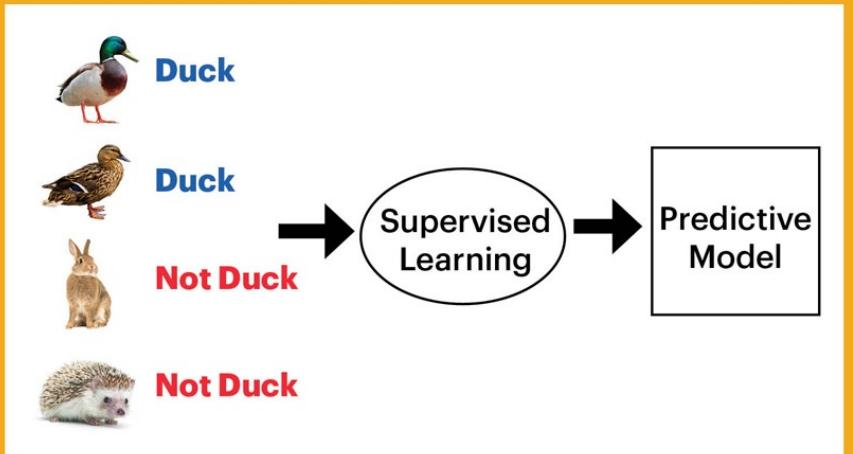

August Landmesser in 1936

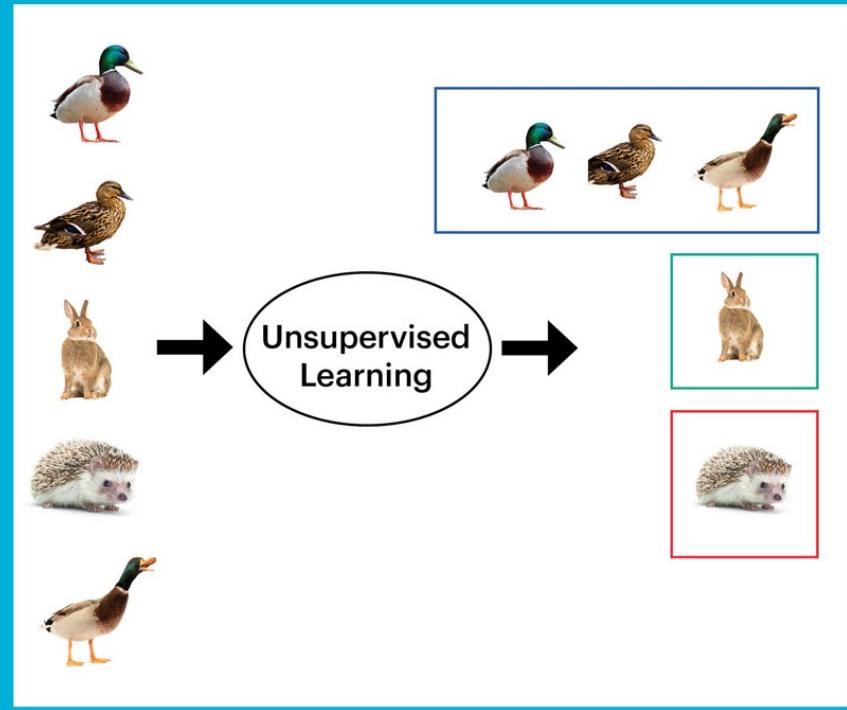

# Data classification

- When data has a special feature known as a **class label**
- A model can **learn** from previous data to associate a record/row to a class label
- Applications:
  - Too many to list here :-)

## Supervised Learning (Classification Algorithm)

## Unsupervised Learning (Clustering Algorithm)

# Tasks with complex data types

- Frequent temporal patterns
- Time series motifs
- Graph motifs
- Trajectory clusters
- Collective classification
- ...

# Data types x Prototypical problems

| Problem        | Time series                                     | Spatial   | Sequence   | Networks  |
|----------------|---|---|--|---|
| Patterns       | Motif-mining<br>Periodic pattern                | Colocation patterns                             | Sequential patterns<br>Periodic Sequence           | Structural patterns                                   |
|                | Trajectory patterns                             |   |  |   |
| Clustering     | Shape clusters                                  | Spatial clusters                                | Sequence clusters                                  | Community detection                                   |
|                | Trajectory clusters                             |   |  |   |
| Outliers       | Position outlier<br>Shape outlier               | Position outlier<br>Shape outlier               | Position outlier<br>Combination outlier            | Node outlier<br>Linkage outlier<br>Community outliers |
|                | Trajectory outliers                             |   |  |   |
| Classification | Position classification<br>Shape classification | Position classification<br>Shape classification | Position classification<br>Sequence classification | Collective classification<br>Graph classification     |
|                | Trajectory classification                       |   |  |   |

# Example scenarios

# Example scenario 1

- Place products in a store to maximize co-purchases of items frequently bought together
  - Input data: baskets
  - Output: similar pairs
  - Algorithm: frequent pattern mining

# Example scenario 2

- Recommend movies to users in a video-on-demand platform
  - Input data: viewing history
  - Output: recommendations for a user
  - Simple algorithm: k nearest neighbors

# Example scenario 3

- Help diagnose if an electrocardiogram is associated to a health problem
  - Input data: time series, possibly multi-dimensional
  - Output: binary label or risk score
  - Algorithms: **outlier detection** or **classification**

# Example scenario 4

- Help a sysadmin determine if an intruder is trying or has accessed the network
  - Input data: time series of event records
  - Output: binary label or risk score
  - Algorithms: **event detection**

# Are these data mining tasks?

- A) Dividing the customers of a company by gender
- B) Finding credit card scammers among customers of a company
- C) Computing the total sales of a company
- D) Sorting a student database by student identification number
- E) Predicting the future stock price of a company using past records
- F) Determine when a complex machine needs to be repaired
- G) Extracting the frequencies of a sound wave

# Major challenges

# Methodological challenges

- Mining new kinds of knowledge
- Mining multidimensional data
- Fully utilizing the expertise of domain experts who know the data better
- Handling uncertainty, noise, incompleteness

# User interaction challenges

- Allowing users to ask the questions that matter to them
- Performing interactive mining
- Presenting and visualizing data mining results

# Efficiency and scalability

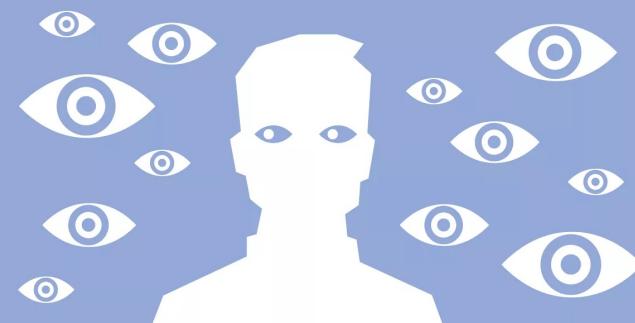

- Data cannot be stored in a single machine
  - Processing time of an algorithm might be exponential in input ... or even polynomial, even with small degree: **a process can become unreasonably slow very quickly**
  - **Streaming algorithms**
  - **Parallel/distributed mining algorithms**

# Diversity of database types

- Real databases are a **complex mixture of very rich and diverse** data types
- Mining dynamic, networked, global data repositories
  - Integrating from complementary sources

# Data mining can be harmful

- Social impacts of data mining
  - Who wins? And more importantly, who loses?
- Privacy-preserving data mining
  - Avoid invisible, pervasive, invasive data mining

# Summary

# Things to remember

- Prototypical data mining scenarios
- Types of data mining methods
- Data types
- Data mining challenges

# Exercises for this topic

- **Section 1.9 of Data Mining, The Textbook (2015) by Charu Aggarwal**
- Exercises 1.7 of Introduction to Data Mining, Second Edition (2019) by Tan et al.
